this volume includes versions of papers selected from those presented at the thiesel 2000 conference on thermofluidynamic processes in diesel engines held at the universidad politecnica de valencia during the period of september th th 13 to 15 2000 the papers are grouped into seven thematic areas state of the art and prospective fuels for diesel engines injection system and spray formation combustion and pollutant formation modelling experimental techniques and air management these areas cover most of the technologies and research strategies that may allow light duty and heavy duty diesel engines to comply with current and forthcoming emission standards while maintaining or improving fuel consumption the main objectives of the conference were to bring together ideas and experience from industry and universities to facilitate interchange of information and to promote discussion of future research and development needs the technical papers emphasised the use diagnostic and simulation techniques and their relationship to engineering practice and the advancement of the diesel engine we hope that this approach which proved to be successful at the conference is reflected in this volume we thank all those who contributed to the success of the conference and particularly the members of the advisory committee who assessed abstracts and chaired many of the technical sessions weare also grateful to participants who presented their work or contributed to the many discussions finally the conference benefitted from financial support from the organisations listed below and we are glad to have this opportunity to record our gratitude

the diesel engine is by far the most popular powerplant for boats of all sizes both power and sail with the right care and maintenance it is twice as reliable as the petrol engine as it has no electrical ignition system which in the marine environment can suffer from the effects of damp surroundings self sufficiency at sea and the ability to solve minor engine problems without having to alert the lifeboat is an essential part of good seamanship marine diesel engines explains through diagrams and stage by stage photographs everything a boat owner needs to know to keep their boat s engine in good order how to rectify simple faults and how to save a great deal of money on annual service charges unlike a workshop manual that explains no more than how to perform certain tasks this book offers a detailed step by step guide to essential maintenance procedures whilst explaining exactly why each job is required

this is the second book edited with a selection of papers from the two yearly thiesel conference on thermo and fluid dynamic processes in diesel engines organised by cmt mytores termicos of the universidad po itecnica de valencia spain this volume includes versions of papers selected from those presented at the thiesel 2002 conference th held on loth to 13 september 2002 we hope it will be the second volume of a long series reflecting the quality of the thiesel conference this year the papers are grouped in six main thematic areas state of the art and prospective injection systems and spray formation combustion and emissions engine modelling alternative combustion concepts and experimental techniques the actual conference covered a wider scope of topics including air management and fuels for diesel engines and a couple of papers included reflect this variety however the selection of papers published here represents the most current preoccupations of diesel engine designers namely how to improve the combustion process using new injection strategies and alternative concepts such as the homogeneous charge combustion ignition
