this book helps students and readers visualize the three dimensional atomic and molecular structures that are the basis of chemical action an integral part of the text is to develop an explanation to hybridization which introduced to explain molecular structure when the valence bond theory failed to correctly envisage them dr elasersawi presents the quantum theory of the electronic structure of atoms and focuses on the electronic structures and reactivity of atoms and molecules many questions and answers of chemical components are introduced using molecular orbital and hybridization of orbitals the book has been made more informative and the subject matter has been presented in a very simple language clear style along with a large number of fully illustrative diagrams atoms molecules ions chemical formulas and equations chemical bondings intermolecular forces energies electronegativity are offered to readers in effective and proven features clarity of writing and explanation if you are finding that lewis dot structures are not enough for representing the atoms and molecules you are dealing with as a chemist then this is the book for you overall this volume answers frequently asked questions and highlights the most important hybridized

in 1922 preface the title of this book has been changed from calculations of quantitative chemical analysis to calculations of analytical chemistry because the subject matter has been expanded to cover the stoichiometry of both qualitative and quantitative analysis in order to include calculations usually covered in courses in qualitative analysis some rearrangements of material have been made new sections have been added and chapters dealing with equilibrium constants and with the more elementary aspects of analytical calculations have been considerably expanded altogether the number of sections has been increased from 78 to 114 and the number of problems from 766 to 1 032 the greater part of the book is still devoted to the calculations of quantitative analysis short chapters on conductometric and amperometric titrations and a section on calibration of weights have been added and many other changes and additions have been made at various points in the text a section reviewing the use of logarithms has been inserted and a table of molecular weights covering most of the problems in the book is included in the appendix it is felt that every phase of general analytical chemistry is adequately covered by problems both with and without answers and that most of the problems require reasoning on the part of the student and are not solved by simple substitution in a formula leicester f hamilton stephen g simpson cambridge mass february 1947 contents include preface v part i general analysis chapter i mathematical operations 1 factors influencing the reliability of analytical results 1 2 deviation measures as a means of expressing reliability 2 3 significant figures as a means of expressing reliability 3 4 rules governing the use of significant figures in chemical computations 3 5 conventions regarding the solution of numerical problems 6 problems 1 18 7 6 rules governing the use of logarithms 9 7 method of using logarithm tables 13 8 use of the slide rule 14 problems 19 24 15 chapter ii chemical equations 9 purpose of chemical equations 16 10 types of chemical equations 16 11 ionization of acids bases and salts 17 12 ionic equations not involving oxidation 18 13 oxidation number 20 14 ionic oxidation and reduction equations 21 problems 25 43 24 chapter iii calculations based on formulas and equations 15 mathematical significance of a chemical formula 28 16 formula weights 28 17 mathematical significance of a chemical equation 29 problems 44 70 32 chapter iv concentration of degrees solutions 18 methods of expressing concentration 36 19 grains per unit volume 36 vii contents 20 percentage composition 36 21 specific gravity 36 22 volume ratios 37 23 molar and formal solutions 37 24 equivalent weight and normal solution 38 25 simple calculations involving equivalents milliequivalents and normality 39 problems 71 86 43 chapter v equilibrium constants 26 law of mass action 46 27 ion product constant of water 47 28 p_{H} value 48 problems 87 94 49 29 ionization constant 50 30 common ion effect buffered solution 52 31 ionization of polybasic ac

this work evolved over thirty combined years of teaching general chemistry to a variety of student demographics the focus is not to recap or review the theoretical concepts well described in the available texts instead the topics and descriptions in this book make available specific detailed step by step methods and procedures for solving the major types of problems in general chemistry explanations instructional process sequences solved examples and completely solved practice problems are greatly expanded containing significantly more detail than can usually be devoted to in a comprehensive text many chapters also provide alternative viewpoints as an aid to understanding key features the authors have included every major topic in the first semester of general chemistry and most major topics from the second semester each is written in a specific and detailed step by step process for problem solving whether mathematical or conceptual each topic has greatly expanded examples and solved practice problems containing significantly more detail than found in comprehensive texts includes a chapter designed to eliminate confusion concerning acid base reactions which often persists through working with acid base equilibrium many chapters provide alternative viewpoints as an aid to understanding this book addresses a very real need for a large number of incoming freshman in stem fields
