this book reviews recent approaches for partial identification of average treatment effects with instrumental variables in the program evaluation literature including manski s bounds bounds based on threshold crossing models and bounds based on the local average treatment effect late framework it compares these bounds across different sets of assumptions surveys relevant methods to assess the validity of these assumptions and discusses estimation and inference methods for the bounds the book also reviews some empirical applications employing bounds in the program evaluation literature it aims to bridge the gap between the econometric theory on which the different bounds are based and their empirical application to program evaluation

this book comprises a large selection of papers presented at the second european scientific computing and automation meeting sca 90 europe which was held in june 1990 in maastricht the netherlands the increasing use of computers for making measurements interpreting data and filing results brings a new unity to science sca concentrates on common computer based tools which are useful in several disciplines practical problems in laboratory automation robotics and information management with lims are covered in depth the process of designing and acquiring a lims is described and standards for data transfer between instruments between lims and instruments and between different lims are discussed the applications of statistics and expert systems are covered in several chapters strategies for drug design are discussed with various practical examples finally the display of scientific results as images and computer based animations is demonstrated by several examples with their color illustrations the book should be of interest to those managing r d projects doing research in laboratories acquiring or planning lims designing instruments and laboratory automation systems and those involved in data analysis of scientific results

the adme encyclopedia covers pharmacokinetic phenomena absorption distribution metabolism and excretion processes and their relationship with the design of pharmaceutical carriers and the success of drug therapies it

covers both basic and advanced knowledge serving as introductory material for students of biomedical careers and also as reference updated material for graduates and professionals working in any field related to pharmaceutical sciences medicine pharmaceutical technology materials science medicinal chemistry structured as alphabetically ordered entries with cross references the encyclopedia not only provides basic knowledge on adme processes but also detailed entries on some advanced subjects such as drug transporters last generation pharmaceutical carriers pharmacogenomics personalized medicine bioequivalence studies biowaivers biopharmaceuticals gene delivery pharmacometrics pharmacokinetic drug interactions or in silico and in vitro assessment of adme properties

here is the second revised and updated edition of probably the most practical sourcebook on similarity methods and modeling techniques available written by leading authorities who incorporate many of the latest advances in the field this new work maps out techniques for modeling as well as instrumentation and data analysis for an extremely wide array of problems in engineering dynamics this practical reference uses experimental test data on various engineering problems demonstrating exactly how and why these similarity methods work the problems involve spread of oil slicks explosive cratering car crashes space vehicle heat exchange explosive forming and more the spectrum of topics covered and number of examples are far greater than in other texts of particular importance are the dissimilar material modeling techniques which bring new versatility and freedom to the modeler in structural dynamics the book also contains a clear in depth discussion of the theory underlying modeling and includes alternate methods for developing model laws the work will undoubtedly prove invaluable to every professional involved in testing or design of dynamic experiments

lifelong machine learning or lifelong learning is an advanced machine learning paradigm that learns continuously accumulates the knowledge learned in previous tasks and uses it to help future learning in the process the learner becomes more and more knowledgeable and effective at learning this learning ability is one of the hallmarks of human intelligence however the current dominant machine learning paradigm learns in isolation given a training dataset it runs a machine learning algorithm on the dataset to produce a model it makes no attempt to retain the learned knowledge and use it in future learning although this isolated learning paradigm has been very successful it requires a large number of training examples and is only suitable for well defined and narrow tasks in comparison we humans can learn effectively with a few examples because we have accumulated so much knowledge in the past which enables us to learn with little data or effort lifelong learning aims to achieve this capability as statistical machine learning matures it is time to make a major effort to break the isolated learning tradition and to study lifelong learning to bring machine learning to new heights applications such as intelligent assistants chatbots and physical robots that interact with humans and systems in real life environments are also calling for such lifelong learning capabilities without the ability to accumulate the learned knowledge and use it to learn more knowledge incrementally a system will probably never be truly intelligent this book serves as an introductory text and survey to lifelong learning
