this book addresses the development of electronic devices using redox active organic molecules and their porous coordination networks pcns and highlights the importance of the molecular arrangement redox active organic molecules hold considerable promise as flexible electronic elements because their electronic state can easily be controlled using

external energy although various kinds of redox active organic molecules have been synthesized attempts to apply them to electronic devices have been limited owing to the lack of proper structural design moreover ligand based redox active pcns remain largely unexplored because of the limited availability of redox active ligands in addition to developing new redox active organic molecules in order to design electronic devices based on these molecules pcns it is essential to understand the connections between their molecular arrangement electrical properties and redox activity in this thesis the redox active organic molecule 2 5 8 tri 4 pyridyl 1 3 diazaphenalene tpdap which features a large pi plane and multi intermolecular interactivity is used to develop a resistive switching memory device in addition its pcns are synthesized to fabricate chemiresistive sensors and the electrical properties are modulated using post synthetic modification each mechanism is systematically investigated by means of structural determination and well defined control experiments subsequently the book proposes general guidelines for designing electronic devices using redox active organic molecules the book will appeal to a broad range of readers from basic scientists to materials engineers as well as general non expert readers
