khan academy's precalculus course is built to deliver a comprehensive illuminating engaging and common core aligned experience the precalculus course covers complex numbers composite functions trigonometric functions vectors matrices conic sections and probability and combinatorics precalculus is a mathematical course or a set of courses that act as a foundation for calculus the two main topics that are included under precalculus are algebra and trigonometry precalculus courses can be structured differently depending upon the type of career path chosen by students the domain of a function includes all real input values that would not cause us to attempt an undefined mathematical operation such as dividing by zero or taking the square root of a negative number the domain of a function can be determined by listing the input values of a set of ordered pairs see example 1 in this chapter we will learn about these concepts and discover how mathematics can be used in such applications
