over the past two decades there has been a considerable increase in the number of tools to generate analyse and use data and evidence to support discussion and decision making by national tb programmes ntps increasingly countries are developing more robust national surveillance systems implementing multiple health surveys and using data analysis and visualization tools in policy planning programming and investment decisions however as more data are generated and data analysis tools evolve and increase in number it can be challenging to understand how why and when these tools should be implemented the document summarizes information about the key tools related to data and evidence that are available for use in tuberculosis planning and programming

and how they can be applied the tools that are profiled are described in terms of how they fit within the people centred framework for tb programme planning and prioritization it can also be used independently to inform decisions taken by ntps about the implementation of the tools included in this document together with the people centred framework this compendium aims to enable better use of data and evidence for tb programme planning at both the national and subnational levels it is designed to help ntps and their national stakeholders to understand how and when different data and evidence related tools could be used

this third book from editors rick best and jim meikle brings together and presents insights into a number of key concepts in the study of construction firms projects and the group of activities that loosely define the construction industry the value for readers comes from the collection of a variety of topics in a single volume which provide a basic understanding of the complexities of construction as more than a set of practical concerns such as labour management and materials handling instead the focus is on

analysis of the industry and its component parts from the viewpoints of construction economists and others seeking to understand the drivers and challenges that shape an area of economic activity that is a major contributor in all economies the aim of this book is to provide an overview and discussion of several aspects of what makes construction tick it is unlike other industry sectors in many ways being project based with often intense competition for work where the first book measuring construction focused on particular areas associated with quantifying various aspects of construction activity and the second accounting for construction looked more at how we record and report on construction activity describing construction gives readers the views of experts in the field of how the construction industry is described what its make up is it even asks the question is construction a single industry this book will change the way most readers understand the construction industry whatever that may be not from the point of view of visible on site activities but through a scientific approach to analysis and understanding of how projects firms and various sectors of the industry work and how things are changing and may continue to change in future it is essential reading for students and researchers in construction management quantity surveying architecture and engineering

the scientific developments at the end of the past millennium were dominated by the huge increase and diversity of disciplines with the common label computer science the theoretical foundations of such disciplines have become known as theoretical computer science this book highlights some key issues of theoretical computer science as they seem to us now at the beginning of the new millennium the text is based on columns and tutorials published in the bulletin of the european association for theoretical computer science in the period 1995 2000 the columnists themselves selected the material they wanted for the book and the editors had a chance to update their work indeed much of the material presented here appears in a form quite different from the original since the presentation of most of the articles is reader friendly and does not presuppose much knowledge of the area the book constitutes suitable supplementary reading material for various courses in computer science
