there are unique complexities associated with the economic valuation of intelligent transportation systems its and telematics traditional methods of quantitative analysis may not be appropriate in accurately and reliably assessing the economic impacts of these technologies although advanced transportation and related technologies are being planned and deployed at an increasingly rapid pace many of the technologies are still relatively new and their use may not be widespread much of the initial information and statistics gathered have been anecdotal and have focused more on benefits rather than costs therefore difficulties arise due to the lack of historical data and lessons learned from which to draw upon in addition compared with traditional transportation infrastructure its technologies have different life cycles cost structures and a number of interrelated elements this book addresses these concerns and proposes new economic assessment techniques as well as modifications to existing ones included are case studies from a multitude of north american european and asian nations and major metropolitan areas covering a wide range of its technologies including freeway management electronic toll collection advanced driver assistance systems and traveller information systems
