the implementation of enterprise networks or e networking is of paramount importance for organisations enterprise wide networking would warrant that the components of information architecture are organised to harness more out of the organisation s computing power on the desktop this would also involve establishment of networks that link the various but important subsystems of the enterprise our firm belief is that in order to gain a competitive edge the organisations need

knowledge and sound strategy this conviction is particularly true today considering the pressures from international competition environmental concerns and complicated ethical issues this book entitled a manager s primer on e networking negotiates the hyper dimensions of the internet through stories from myriad of sites with its fluent presentation and simple but chronological organisation of topics highlighting numerous opportunities and providing a solid starting point not only for inexperienced entrepreneurs and managers but anyone interested in applying information technology in the business i sincerely hope the book will help as well many small and medium size companies and organisations to launch corporate networking successfully in order to attain their strategic objectives rajiv jayashankar ph d

the architectural concept of a memory hierarchy has been immensely successful making possible today s spectacular pace of technology evolution in both the volume of data and the speed of data access its success is difficult to understand however when examined within the traditional memoryless framework of performance analysis the memoryless framework cannot properly reflect a memory hierarchy s ability to take advantage of patterns of data use that are transient the fractal structure of

data reference applications to the memory hierarchy both introduces and justifies empirically an alternative modeling framework in which arrivals are driven by a statistically self similar underlying process and are transient in nature the substance of this book comes from the ability of the model to impose a mathematically tractable structure on important problems involving the operation and performance of a memory hierarchy it describes events as they play out at a wide range of time scales from the operation of file buffers and storage control cache to a statistical view of entire disk storage applications striking insights are obtained about how memory hierarchies work and how to exploit them to best advantage the emphasis is on the practical application of such results the fractal structure of data reference applications to the memory hierarchy will be of interest to professionals working in the area of applied computer performance and capacity planning particularly those with a focus on disk storage the book is also an excellent reference for those interested in database and data structure research

this volume is part of a publication series emerging from an international interdisciplinary study group on new technologies and work network network is sponsored by the werner reimers foundation bad homburg germany and holds various

sciences de l homme paris the network study group has set itself the task of intellectually penetrating various problem domains posed by the introduction and spread of new technologies in work settings this problem focus requires interdisciplinary co operation the usual mode of operating is to identify an important problem within the network scope to attempt to prestructure it and then to invite original contributions from european researchers or research teams actively involved in relevant analytic or developmental work a specific workshop serves to cross fertilize the different approaches and to help to integrate more fully the individual contributions the concept of telematics refers to the integration of computer telecommunication and information technologies it alludes to the opportunities presented by the technical means to communicate and transfer data over large distances by intelligent equipment teleshopping teleconferencing teleworking and telebanking are but a few examples of a development which influences both public and private environments both households and workplaces are likely to be thoroughly changed by telematics this publication emphasises the application of telematics in working environments the central questions of the book are how will the present and future development of telematics effect the nature and organization of work and under which conditions will this development be optimal from the various contributions it is clear that telematics is not a single direct cause or determinant of particular changes in work and organization the development

and application of telematics depend on decision making of actors at a political scene both outside and inside the work organizations the effects of the use of these applications appear to be co determined by many other factors in fact the technology interacts with political economic and social factors in a complex process that shapes new organizational forms and work relationships
