Advances in Condensed-Matter and Materials Physics

2020-05-06

this book condensed matter and material physics incorporates the work of multiple authors to enhance the theoretical as well as experimental knowledge of materials the investigation of crystalline solids is a growing need in the electronics industry micro and nano transistors require an in depth understanding of semiconductors of different groups amorphous materials on the other hand as non equilibrium materials are widely applied in sensors and other medical and industrial applications superconducting magnets composite materials lasers and many more applications are integral parts of our daily lives superfluids liquid crystals and polymers are undergoing active research throughout the world hence profound information on the nature and application of various materials is in demand this book bestows on the reader a deep knowledge of physics behind the concepts perspectives characteristic properties and prospects the book was constructed using 10 contributions from experts in diversified fields of condensed matter and material physics and its technology from over 15 research institutes across the globe

The Physics of Solar Energy Conversion 2011-03-22

research on advanced energy conversion devices such as solar cells has intensified in the last two decades a broad landscape of candidate materials and devices were discovered and systematically studied for effective solar energy conversion and utilization new concepts have emerged forming a rather powerful picture embracing the mechanisms and limitation to efficiencies of different types of devices the physics of solar energy conversion introduces the main physico chemical principles that govern the operation of energy devices for energy conversion and storage with a detailed view of the principles of solar energy conversion using advanced materials key features include highlights recent rapid advances with the discovery of perovskite solar cells and their development analyzes the properties of organic solar cells lithium ion batteries light emitting diodes and the semiconductor materials for hydrogen production by water splitting embraces concepts from nanostructured and highly disordered materials to lead halide perovskite solar cells takes a broad perspective and comprehensively addresses the

ever since 1911 the solvay conferences have shaped modern physics the format is quite different from other conferences as the emphasis is placed on discussion the 28th edition held in may 2022 in brussels and chaired by david gross and peter zoller continued this tradition and addressed some of the most pressing open questions in the fields of quantum information gathering many of the leading figures working on a wide variety of profound problems the proceedings contain the rapporteur talks giving a broad overview with unique insights by distinguished renowned scientists these lectures cover the five sessions the physics of quantum information many body entanglement quantum information and spacetime quantum platforms quantum algorithms in the solvay tradition the proceedings also include the prepared comments to the rapporteur talks the discussions among the participants expert yet lively and sometimes contentious have been edited to retain their flavor and are reproduced in full the reader is taken on a breathtaking ride through a fascinating field which is expanding rapidly
